Collected Knowledge & Wisdom on

FavQs

Provides:

This API provides access to a wealth of quotes and their respective owners.

Key Provisioning: **Pain factor** (*0=ezpz...5=nightmare*): **2**

- You must register an account with FavQs
- After registering said account, you are able to generate (multiple) API keys

Quotas:

You shall not:
- Display more than 30 FavQs quotes per page in your application or use an unreasonable amount of bandwidth.

The Good:

- The Quote of the Day requires no API key!
- The API seems very similar to NASA's, meaning it's relative difficulty should be small.
- Unlimited API keys per user can be generated and they can be active/inactive!
- Many example API calls, and you can select which type of information you're seeking

The Bad:

- One needs to make an account to obtain API key making access.

The Ugly:

- Unclear on how to utilize the API key in the URL as no examples with the key are given. I have tried many possible field variations for API key (*token, auth_token, api_key*) but none worked.
- Functionality limited to the Quote of the Day if one cannot figure out how to incorporate API key into the query string (basically, what is it's query string field name?)
